Question Correct	Write a program that prints a simple chessboard.
Marked out of 3.00 Flag	Input format:
question	The first line contains the number of inputs T.
	The lines after that contain a different values for size of the
	chessboard
	Output format:
	Print a chessboard of dimensions size * size. Print a Print W for white spaces and B for black spaces.
	Input:
	2
	3
	5
	Output:
	MBM
	BMB
	MBM
	MBMBM
	BMBMB
	MBMBM
	BMBMB

MBMBM

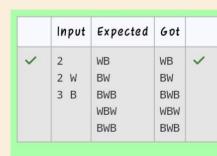

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
 2
    int main()
 3 + {
 4
         int T,d,i=0,i1,i2,o;
 5
         char c;
         scanf("%d",&T);
 6
 7
         while(i<T)</pre>
 8 +
              scanf("%d",&d);
 9
10

Question Correct Marked out of 3.00 Flag question	The k-digit number N is an Armstrong number if and only if the k-th power of each digit sums to N. Given a positive integer N, return true if and only if it is an Armstrong number.
	Example 1:
	Input:
	153
	Output:
	true
	Explanation:
	153 is a 3-digit number, and 153 = 1^3 + 5^3 + 3^3.
	Example 2:
	Input:
	123
	Output:
	false
	Explanation:
	123 is a 3-digit number, and 123 != 1^3 + 2^3 + 3^3 = 36.
	Example 3:
	Input:
	1634
	Output:
	true
	Note:

Ouestion 3

Correct

Marked out of 7.00

Flag
question

A number is considered lucky if it contains either 3 or 4 or 3 and 4 both in it. Write a program to print the nth lucky number. Example, 1st lucky number is 3, and 2nd lucky number is 4 and 3rd lucky number is 33 and 4th lucky number is 34 and so on. Note that 13, 40 etc., are not lucky as they have other numbers in it.

The program should accept a number 'n' as input and display the nth lucky number as output. Sample Input 1: 3 Sample Output 1: 33 Explanation: Here the lucky numbers are 3, 4, 33, 34., and the 3rd lucky number is 33. Sample Input 2: 34 Sample Output 2:

33344
